

Transcript - Testing Freemarker Using The Webhook Site

0:05

First identify a free marker script that we want to test.

0:09

Here you can see a simple script with some basic conditional logic.

0:14

Now we would like to evaluate the script and see its result.

0:18

To do so, we can open a new Internet browser tab and navigate to www.webhook.site.

0:26

Here you will notice a unique URL generated under the Your Unique URL title.

0:32

Copy the URL information.

0:35

We will use this page to view the outcome of the script.

0:39

Leave this page open as we will need it for our test later.

0:43

Navigate back to one trust.

0:46

Update the request URL input field with the copied URL from the method field.

0:52

Select POST.

0:54

Selecting GET will mean we cannot see the free marker script.

0:58

Once done, select Finish from the top right hand corner, select Save to save our latest changes, then select the Context button and select Test Workflow.

1:10

Here you will want to select one of your previously configured events, supply a payload, or if it's a scheduled trigger, simply press Test to trigger the integration workflow.

1:21

Once the integration workflow has been triggered, it may take a few moments until you see a result appear in the sidebar.

1:28

This will notify you of any errors that the integration workflow has faced.

1:34

Navigate back to the webhook dot site browser tab that we had previously left open.

1:39

If all worked well, the script inside our actions body should be now visible in the request history.
