

# Transcript - Testing Individual API Actions

0:05

1st we will identify a workflow action that we want to test.

0:09

Make sure that you have configured and added valid integration credentials to the workflow action and configured the request URL.

0:17

Select the method, identified headers and entered request body you want to test.

0:23

Once you have confirmed the configuration of the workflow action, select the Response tab.

0:29

Select the Test Action button to execute configured API call within the workflow action.

0:35

Please be aware this approach will only work if the configured workflow action does not have any dynamic variables configured.

0:43

For workflows that use dynamic variables, a different approach will have to be used.

0:49

If the workflow action has been successful, a Generate Response modal will appear with a response from the configured API call.

0:57

Select Save to save the response as a sample within the workflow action.
